Data Structures and Algorithms

Red-black Trees

#### Announcement

- Will have a make-up lecture this Friday 2:00 3:40 pm
  - Classroom: East Middle Hall 2-101

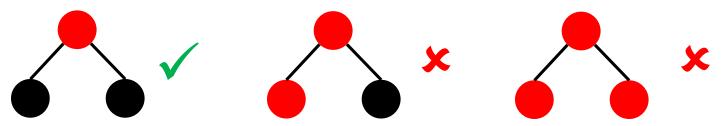

### Outline

• Red-black Trees: Basics

• Red-black Trees: Insertion

### Red-Black Tree

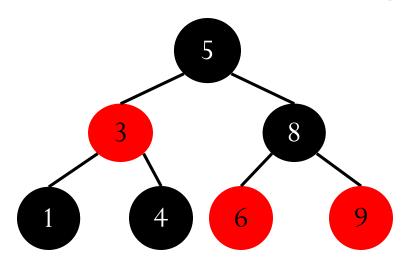

- A binary search tree. The data structure requires an extra one-bit color field in each node.
- Property
- 1. Every node is either red or black.
- 2. Root rule: The root is black.
- 3. Red rule: Red node can only have black children.
  - Can't have two consecutive red nodes on a path.

4. Path rule: Every path from a node x to NULL must have the same number of black nodes (including x itself).

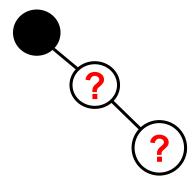

### Red-Black Tree Example

- Property
- 1. Every node is either red or black.
- 2. Root rule: The root is black.
- 3. Red rule: Red node can only have black children.
- 4. Path rule: Every path from a node x to NULL must have the same number of black nodes (including x itself).

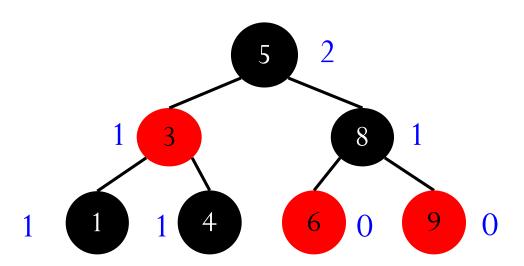

### Counter Example

- Property
- 1. Every node is either red or black.
- 2. Root rule: The root is black.
- 3. Red rule: Red node can only have black children.
- 4. Path rule: Every path from a node x to NULL must have the same number of black nodes (including x itself).
- <u>Claim</u>: a chain of length 3 cannot be a red-black tree

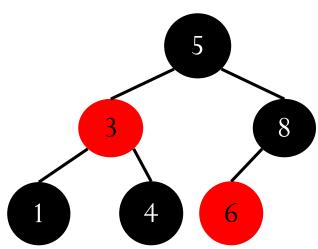

### Black Height

• **Black height** of a node x is the number of black nodes on the path from x to NULL, **including** x itself.

### Implication of the Rules

- If a red node has at least one child, it <u>must have</u> two children and they must be black.
  - Why?
    - A red node's child can only be black.
    - If has only one black child, then violate the **path rule**.
- If a black node has **only one** child, that child **must be** a **red** leaf.
  - Why?
    - Can't be black.
    - Must be a leaf.

### Height Guarantee

- Claim: every red-black tree with n nodes has height  $\leq 2 \log_2(n+1)$ .
- Proof:
  - In a binary tree with n nodes, there is a root-NULL path with  $at most log_2(n+1)$  nodes. (why?)
    - Thus: # black nodes on that path  $\leq \log_2(n+1)$ .
  - By path rule: every root-NULL path has  $\leq \log_2(n+1)$  black nodes.
  - By red rule: every root-NULL path has  $\leq 2 \log_2(n+1)$  total nodes.

    Q.E.D.

### Operations on Red-Black Trees

- All query operations (e.g., search, min, max, succ, pred) work just like those on general BST.
  - They run in  $O(\log n)$  time on a red-black trees with n nodes in the worst case.

- The **modifying** operations "insertion" and "removal" must maintain the red-black tree properties.
  - They are complex.

### Outline

• Red-black Trees: Basics

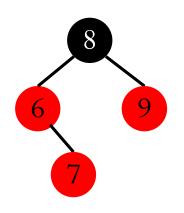

• Red-black Trees: Insertion

#### Insertion

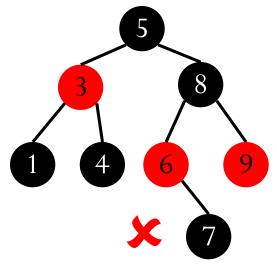

- New node is always a **leaf**.
  - However, it can't be black!
    - Otherwise, violate path rule.
  - Therefore the new leaf must be **red**.

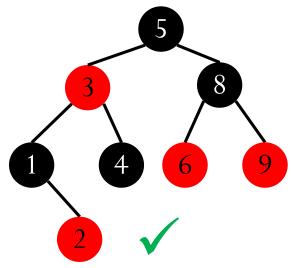

• If parent is red, violate the red rule!

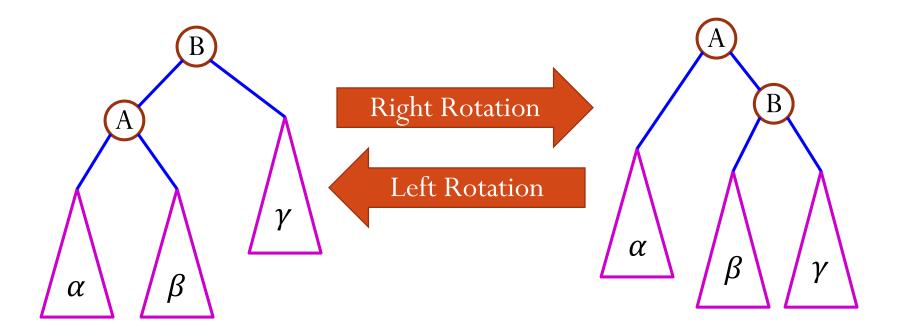

We have to do some work...

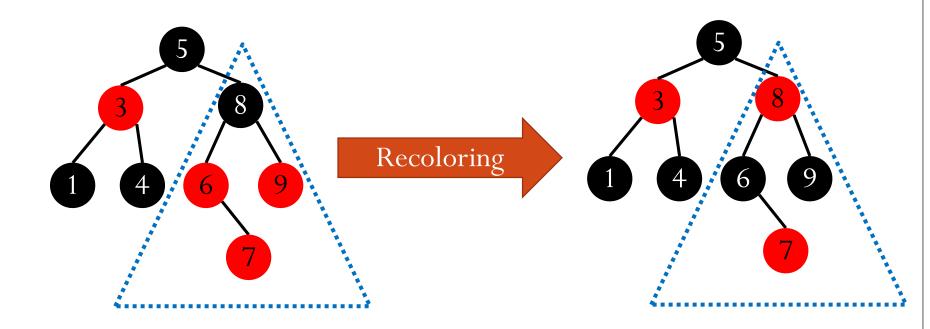

#### Modification: Rotation

- Maintain the binary search tree property.
- Can be done in O(1) time.

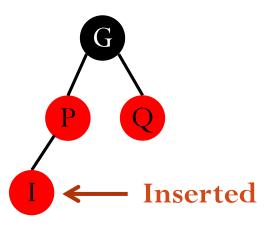

# Modification: Recoloring

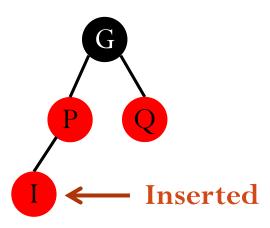

#### Insertion: Sketch

- Insert x as a **leaf**.
- Color x red.
  - Only **red rule** may be violated.
- Move the violation **up the tree** by recoloring/rotation.
  - At some point, the violation will be fixed.

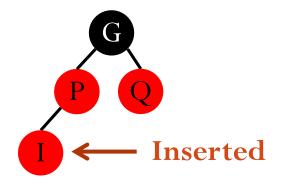

- <u>Note</u>: only <u>red rule</u> may be violated by inserting a (red) node as a leaf.
- When violating, its parent is red and its grandparent is black.
- <u>Denote</u>: the inserted node as "I", its parent as "P", its grandparent as "G".
- Claim: in the old tree, "P" is a leaf, i.e., has no children.

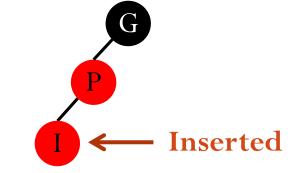

- Assume: the parent "P" is the left child of the grandparent "G".
  - The "right child" case is **symmetric**.
- **<u>Denote</u>**: the right child of the grandparent to be Q.
- <u>Claim</u>: Q is either a red leaf or a NULL.
  - Why?

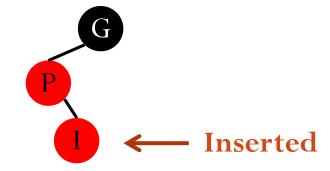

- Three cases:
  - 1. Q is a red leaf.

2. Q is empty; I is P's **left** child.

3. Q is empty; I is P's **right** child.

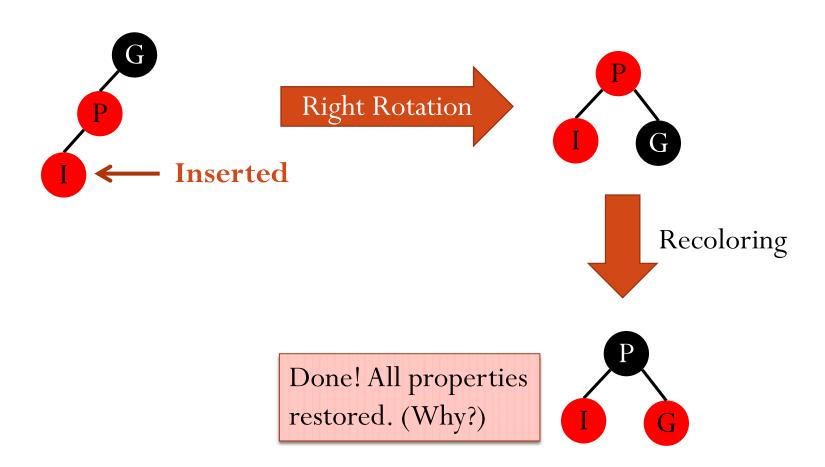

• Case 1: Q is a **red leaf**.

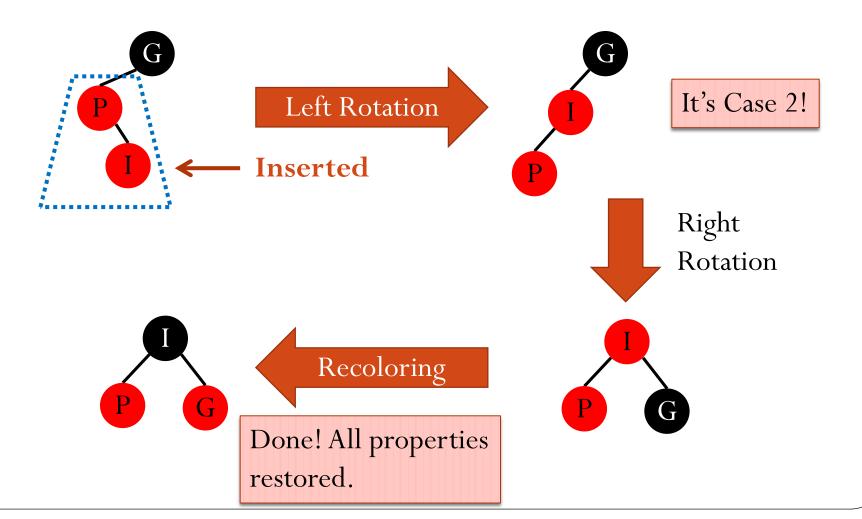

May **recurse**, since G's parent may be red.

• Case 2: Q is empty; I is P's **left** child.

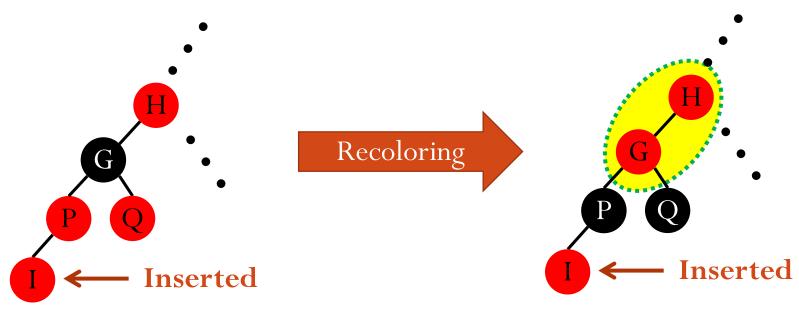

• Case 3: Q is empty; I is P's **right** child.

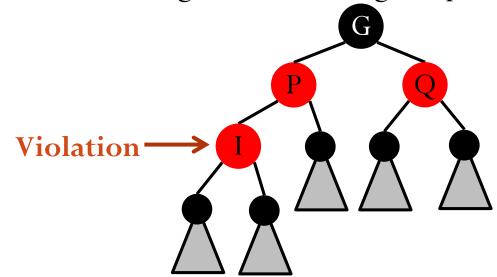

### Violation at Leaf: Summary

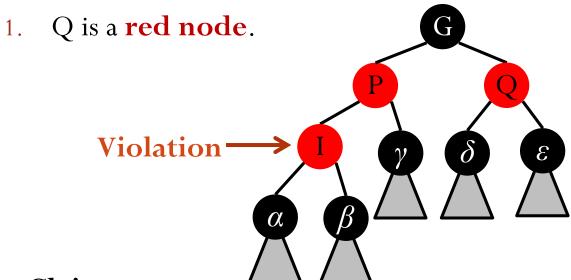

- For Case 2 (Q is empty; I is P's **left** child) and Case 3 (Q is empty; I is P's **right** child), **we're done**.
- For Case 1 (Q is a **red leaf**), we may recurse.
  - Violation of red rule.

- Caused by moving the violation up the tree.
- When violating, its **parent** is **red** and its **grandparent** is **black**.
- <u>Assume</u>: the parent "P" is the **left child** of the grandparent "G". (The "right child" case is **symmetric**.)
- **Denote**: the right child of the grandparent to be Q.

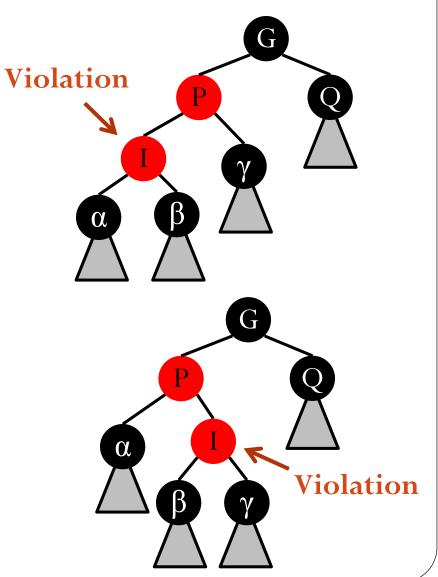

• Three Cases:

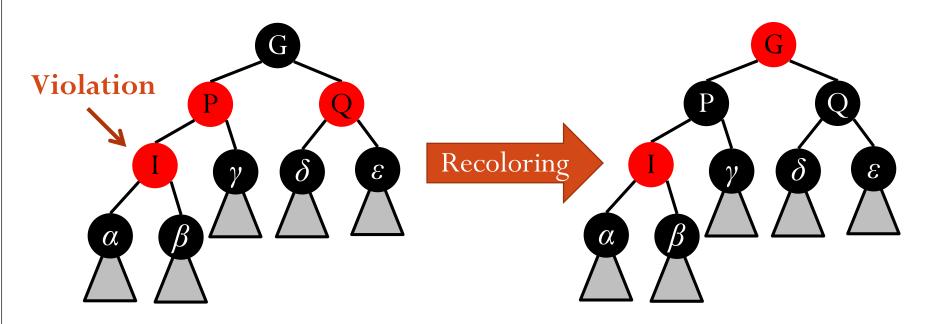

- Claim:
  - $\alpha$ ,  $\beta$ ,  $\gamma$ ,  $\delta$ ,  $\epsilon$  are trees with **black root**.
  - $\alpha$ ,  $\beta$ ,  $\gamma$ ,  $\delta$ ,  $\epsilon$  have the <u>same</u> <u>black height</u>.

- Three Cases:
  - 2. Q is a **black node**; I is P's **left** child.
  - 3. Q is a **black node**; I is P's **right** child.
- Claim for Case 2 and 3:
  - $\alpha$ ,  $\beta$ ,  $\gamma$ , Q are trees with **black** root.
  - $\alpha$ ,  $\beta$ ,  $\gamma$ , Q have the <u>same</u> <u>black</u> <u>height</u>.

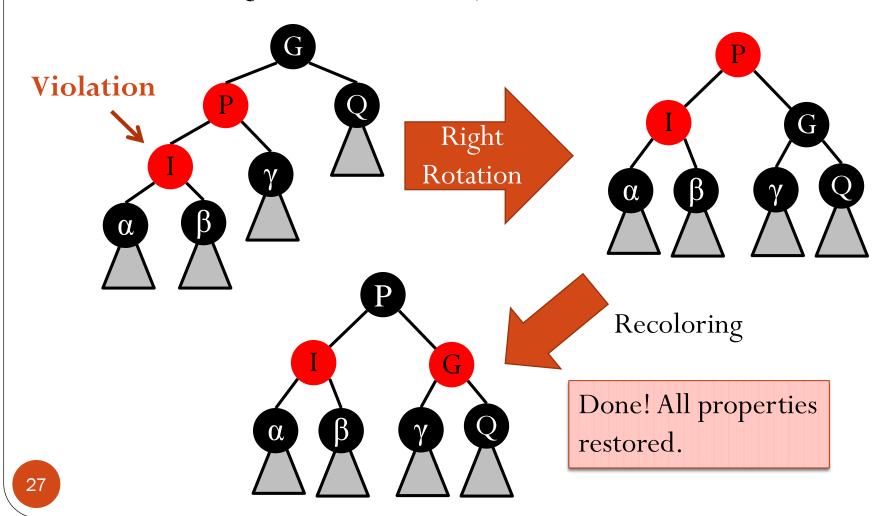

• Case 1: Q is a **red node**.

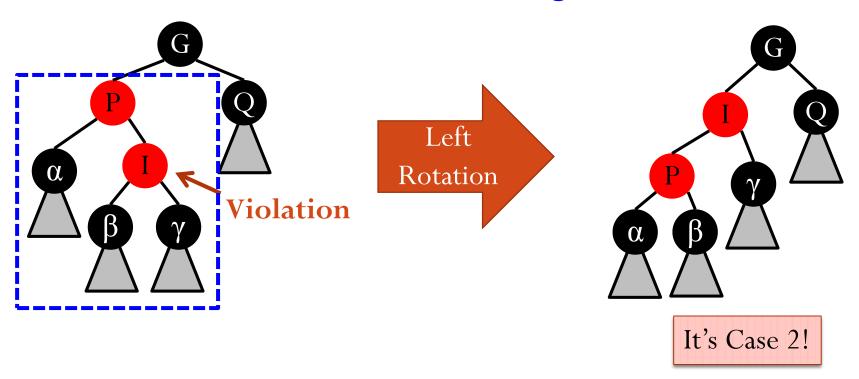

May **recurse**, since G's parent may be red.

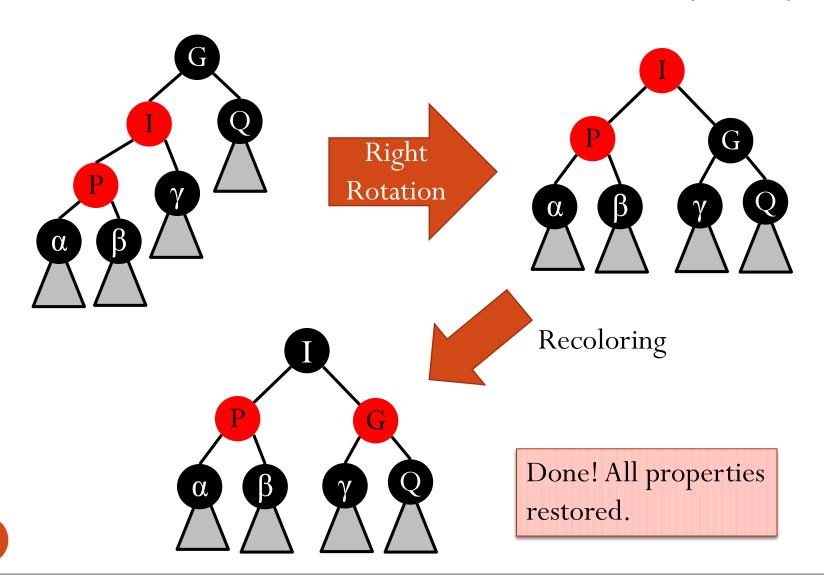

• Case 2: Q is a **black node**; I is P's **left** child.

• Case 3: Q is a **black node**; I is P's **right** child.

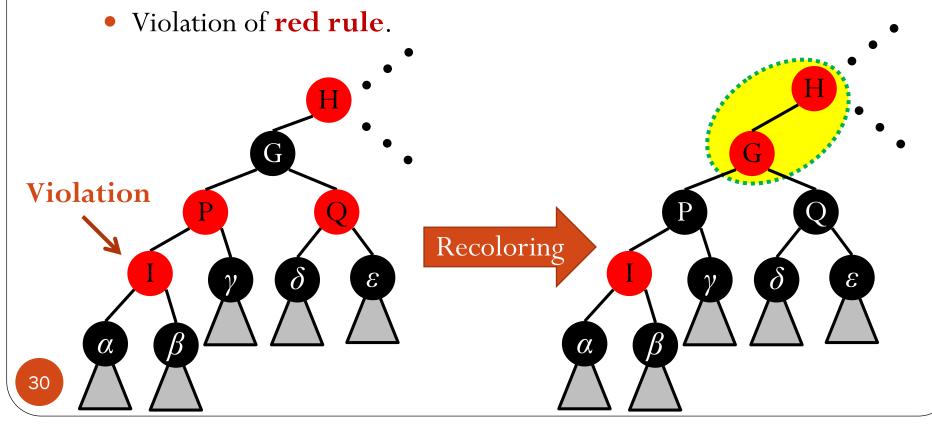

#### Violation at Internal Nodes: Case 3 (cont.)

### Violation at Internal Nodes: Summary

- For Case 2 (Q is a **black node**; I is P's **left** child) and Case 3 (Q is a **black node**; I is P's **right** child), **we're done**.
- For Case 1 (Q is a **red node**), we may recurse.

## Final Step: Violation Fix at the Root

- By moving the violation up the tree ...
  - ... the root may become **red**.
- Final step: set root to be **black**.

• All red-black tree properties are now restored.

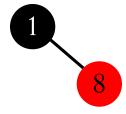

Recoloring
Root

# Example

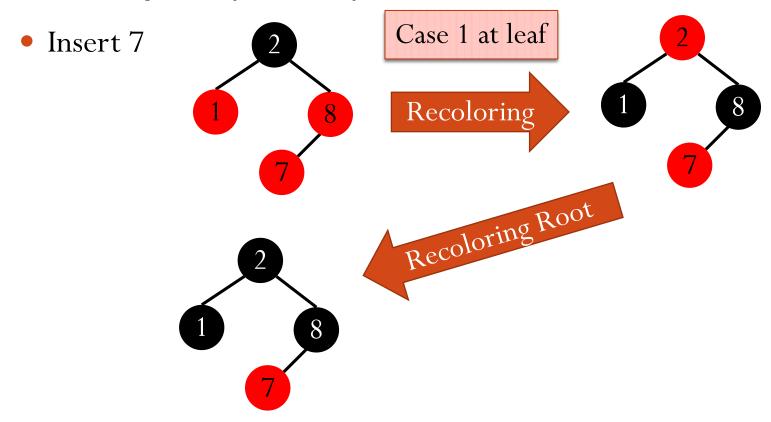

• Insert 1

• Insert 8

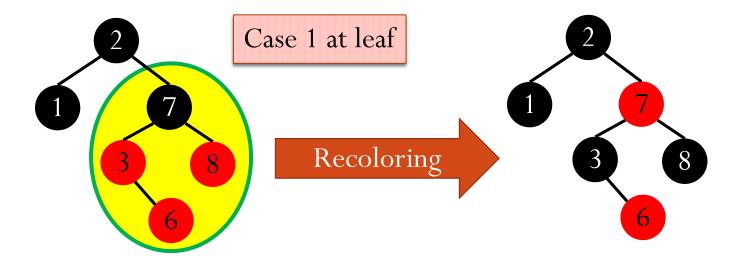

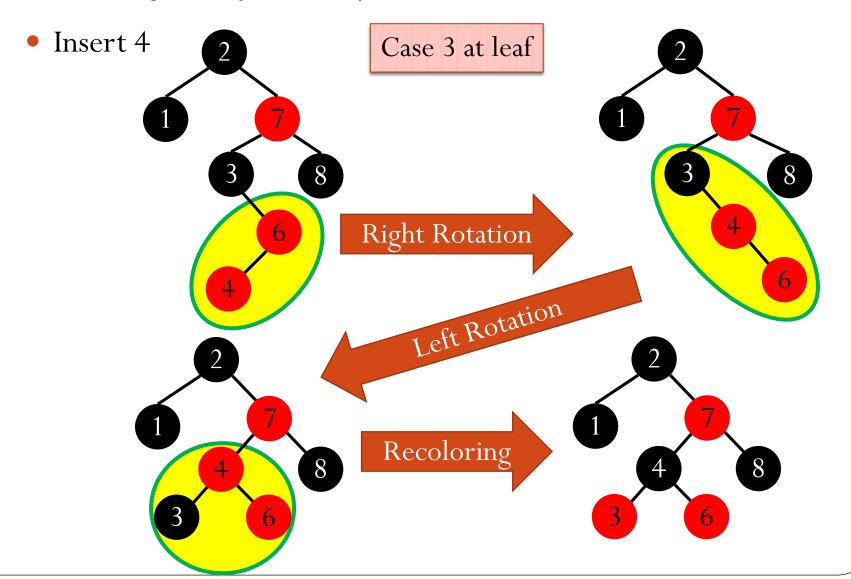

• Insert 2 Case 3 at leaf Right Rotation Left Rotation Recoloring

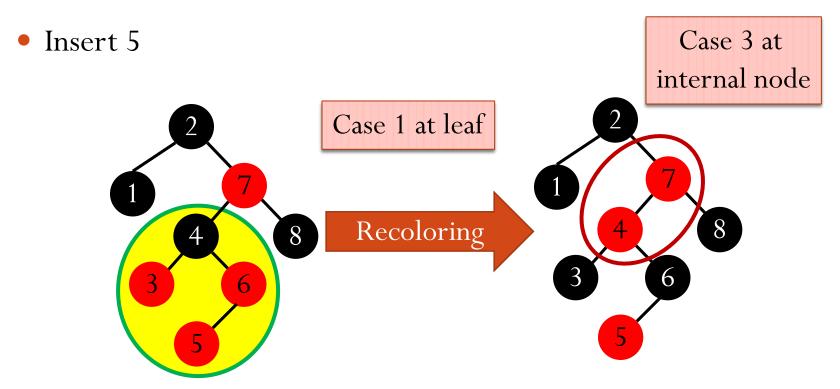

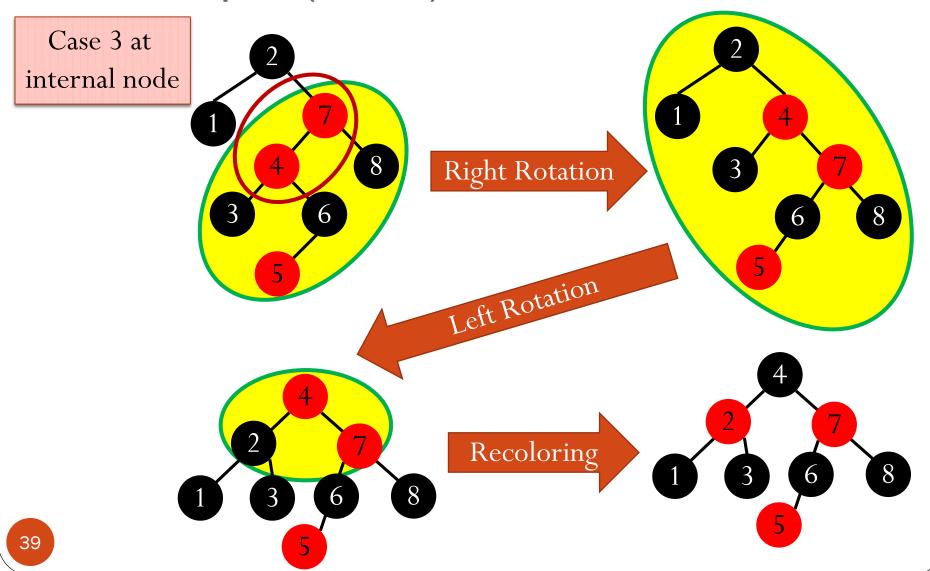

• Insert 3 Case 2 at leaf Right Rotation Recoloring

• Insert 6

### Runtime Complexity

- Number of rotations required
  - For case 1, only need to recolor, **no** rotation.
  - For case 2 or 3, perform 1 or 2 rotations and terminate.
  - Thus: # rotations = O(1).
- Number of recoloring required
  - Worst case:  $O(\log n)$
- Runtime complexity is  $O(\log n)$ .
